

Prompt: Please describe this image in detail.

Frozen LVLM + risk-gated steering at layer ℓ^*

$$R_t = -\cos(\mathbf{h}_t, \mathbf{v}) > \textbf{gate} \Rightarrow \mathbf{h}_t \leftarrow \mathbf{h}_t + \alpha\mathbf{v}$$

gate: (a) constant τ | (b) $\tau_{\text{eff}}(t)$

(a) Static gate: one constant threshold τ at every step

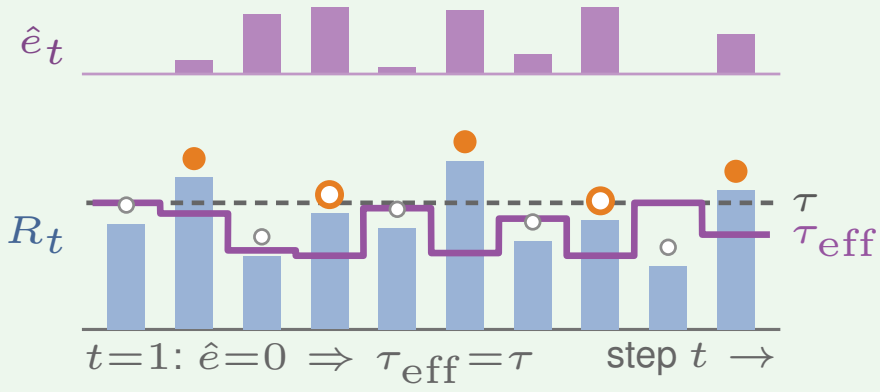

Static gate: . . . Several **pizzas** can be seen on the countertops, with some of them being sliced. Kitchen utensils, such as **knives**, **forks**, and **spoons**, are visible, as well as dining tableware, including **forks**, **knives**, and **spoons**. ✗

(b) EGDR (ours): threshold lowered by preceding-step entropy

logits $\mathbf{q}_{t-1}$ (already computed) → entropy $\hat{H}_{t-1}$ (Eq. 4) → rescale to band $[H_{\text{lo}}, H_{\text{hi}}]$: $\hat{e}_t$ → $\tau_{\text{eff}}(t) = \tau - w_\tau\, \hat{e}_t\, |\tau|$

no extra forward pass, no trained parameter

EGDR: . . . Several **pizza** slices can be seen on plates, with some of them already being sliced. The room is equipped with a dining **table**, where some of the **teenagers** are standing or seated. ✓

risk R_t --- static τ — $\tau_{\text{eff}}(t)$ ● corrected by both ○ by EGDR only ○ not corrected
